Key Takeaways

Overall use of on!® nicotine pouch products led to CPD reduction

- Half of participants were able to **reduce CPD by $\geq 50\%$** by end of study
- Magnitude of **reduction was statistically significant** within each Study Arm
- **Rescue effect** for Delayed Access to Flavors
 - May be possible to ascertain need for “rescue” early

Access to Flavors increased incidence of smoke-free days early

Number of smoke-free days was modest

Flavors were used *more*, liked *more*, and had higher purchase intent

Objectives

Objectives were to assess effects of:

VS

on!® nicotine pouch products provided in 4 mg nicotine level

Altria

Measures & Outcomes

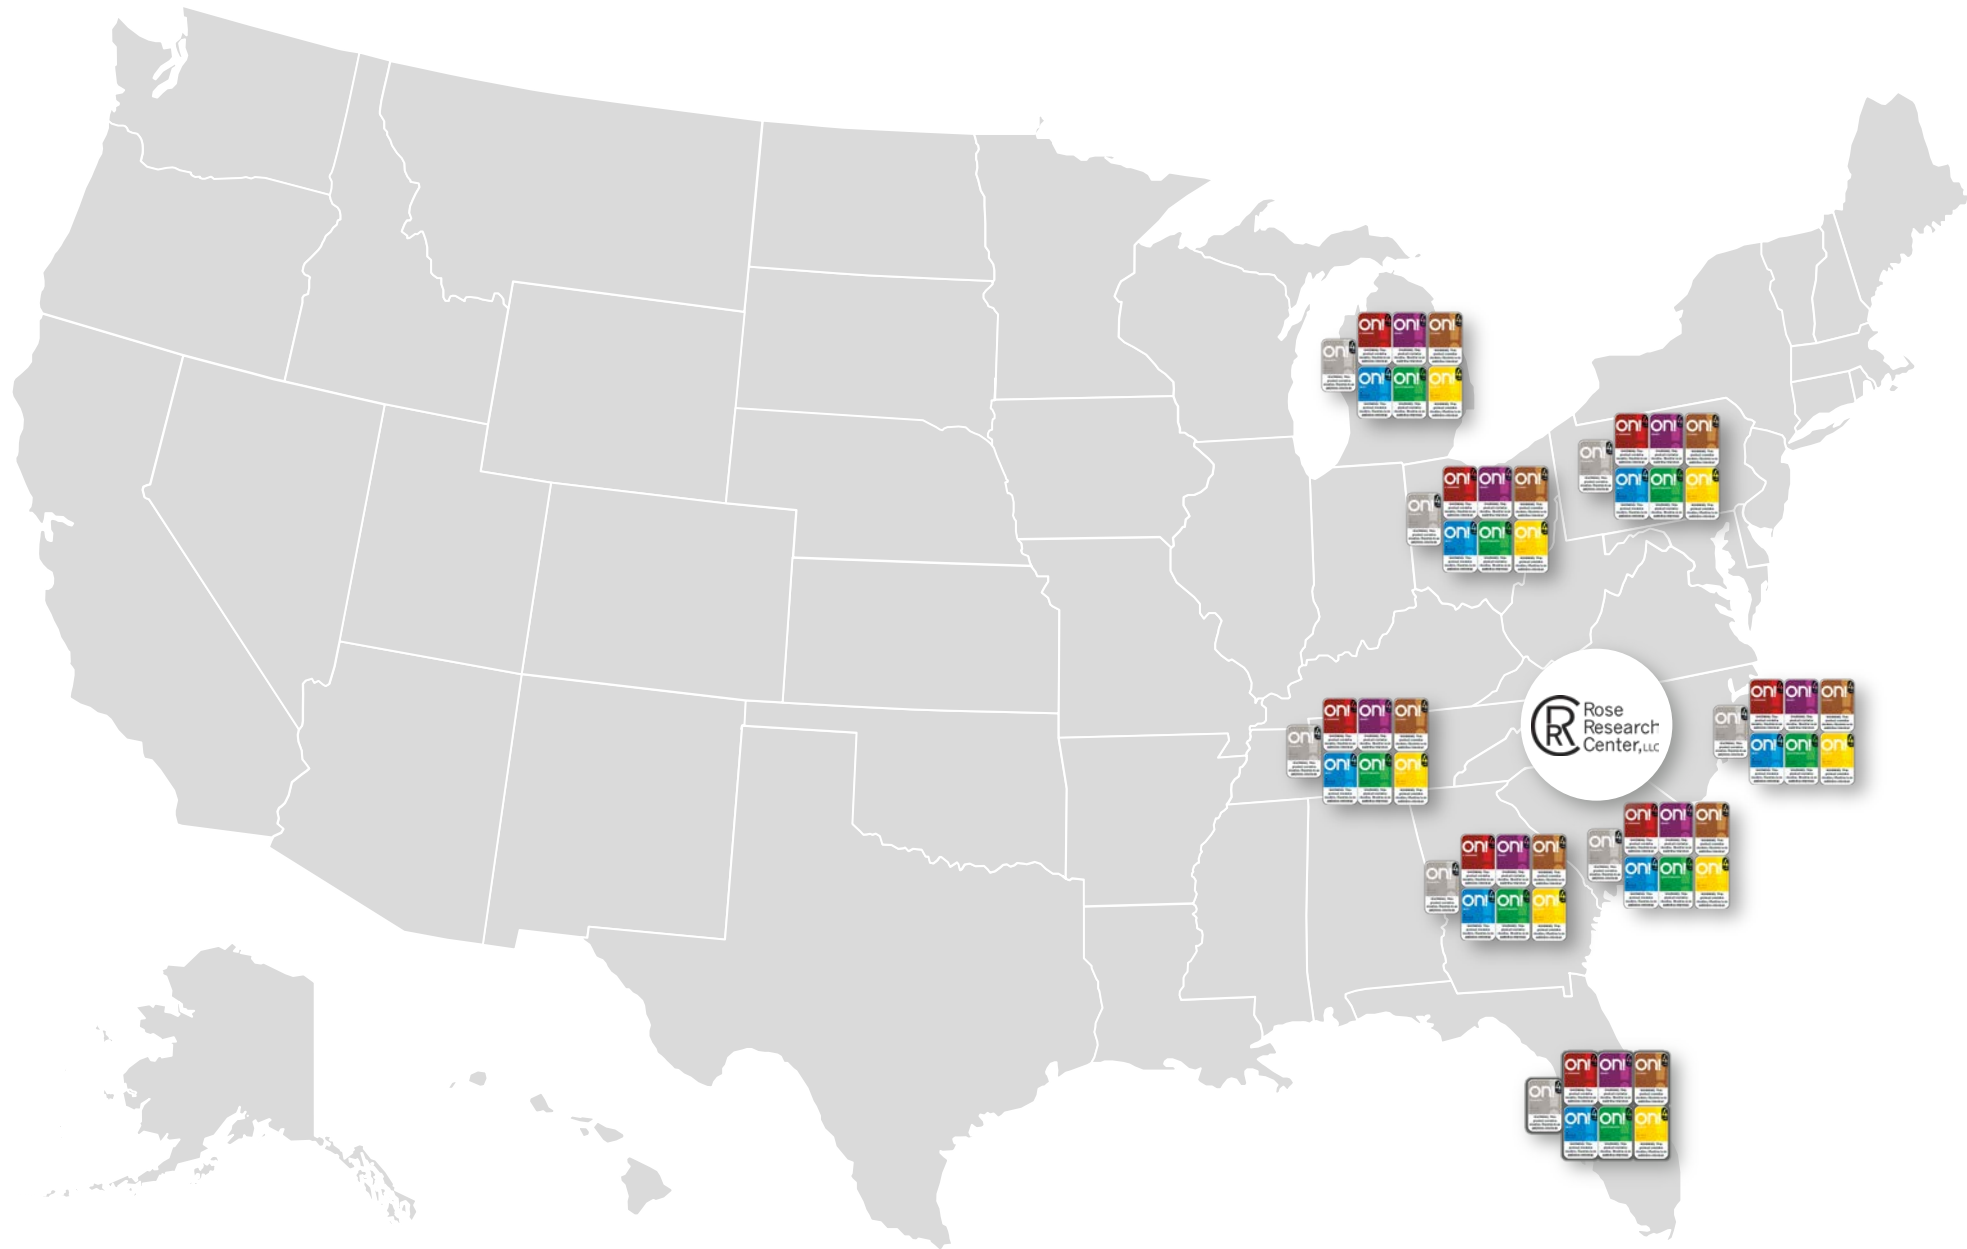

Measure	Frequency Assessed	Binary
Expired-air CO	Every 3 Days	≥50% Reduction from Baseline at Weeks 3 & 6
Number of Cigarettes Smoked	Daily	≥50% Reduction from Baseline at Weeks 3 & 6
Liking	Week 6	N/A
Purchase Intent	Week 6	N/A

Derived Outcomes:

- **Smoking Abstinence:** No cigarettes smoked and CO < 6 ppm for a given week
- **Smoke-free Days:** Number of days without smoking for a given week

Study Population

Select Inclusion Criteria

Aged 22-65 years of age

- Verified via valid government-issued photo identification (e.g., driver's license, passport, etc.)

Smoked ≥ 5
cigarettes daily
for ≥ 12 months prior
to screening

Did not intend
to stop using
tobacco products
within 60 days of
screening

Interested in
replacing
cigarettes with a
smoke-free
nicotine/tobacco
product at screening

Sample Composition

Demographics

		Overall n=400	Flavor n=151	Original + Delayed Flavor n=249
Sex n (%)	Female	198 (49.5%)	79 (52.3%)	119 (47.8%)
	Male	202 (50.5%)	72 (47.7%)	130 (52.2%)
Age n (%)	Mean (SD)	43.8 (10.0)	44.0 (9.9)	43.6 (10.0)
	21-34	83 (20.8%)	28 (18.5%)	55 (22.1%)
	35-44	130 (32.5%)	56 (37.1%)	74 (29.7%)
	45-49	54 (13.5%)	13 (8.6%)	41 (16.5%)
	50-65	133 (33.3%)	54 (35.8%)	79 (31.7%)
Race / Ethnicity n (%)	White NH	296 (74.0%)	113 (74.8%)	183 (73.5%)
	Black NH	46 (11.5%)	15 (9.9%)	31 (12.5%)
	Other NH	24 (6.0%)	9 (6.0%)	15 (6.0%)
	Hispanic	34 (8.5%)	14 (9.3%)	20 (8.0%)
Education n (%)	Less than College	211 (52.8%)	68 (45.0%)	143 (57.4%)
	Some College	146 (36.5%)	66 (43.7%)	80 (32.1%)
	College or Higher	43 (10.8%)	17 (11.3%)	26 (10.4%)

Abbreviations: n=number; SD=standard deviation

Baseline Cigarette Use

		Overall n=399	Flavor n=151	Original + Delayed Flavor n=248
Cigarettes Per Day n (%)	Mean (SD)	13.0 (7.4)	13.3 (7.7)	12.8 (7.3)
	≤10 CPD	157 (39.4%)	57 (37.8%)	100 (40.3%)
	>10 CPD	242 (60.7%)	94 (62.3%)	148 (59.7%)

Abbreviations: n=number; SD=standard deviation; CPD=cigarettes per day
Note. One participant in Original+Delayed Flavor Arm missing baseline CPD

Results

Smoking Reduction:

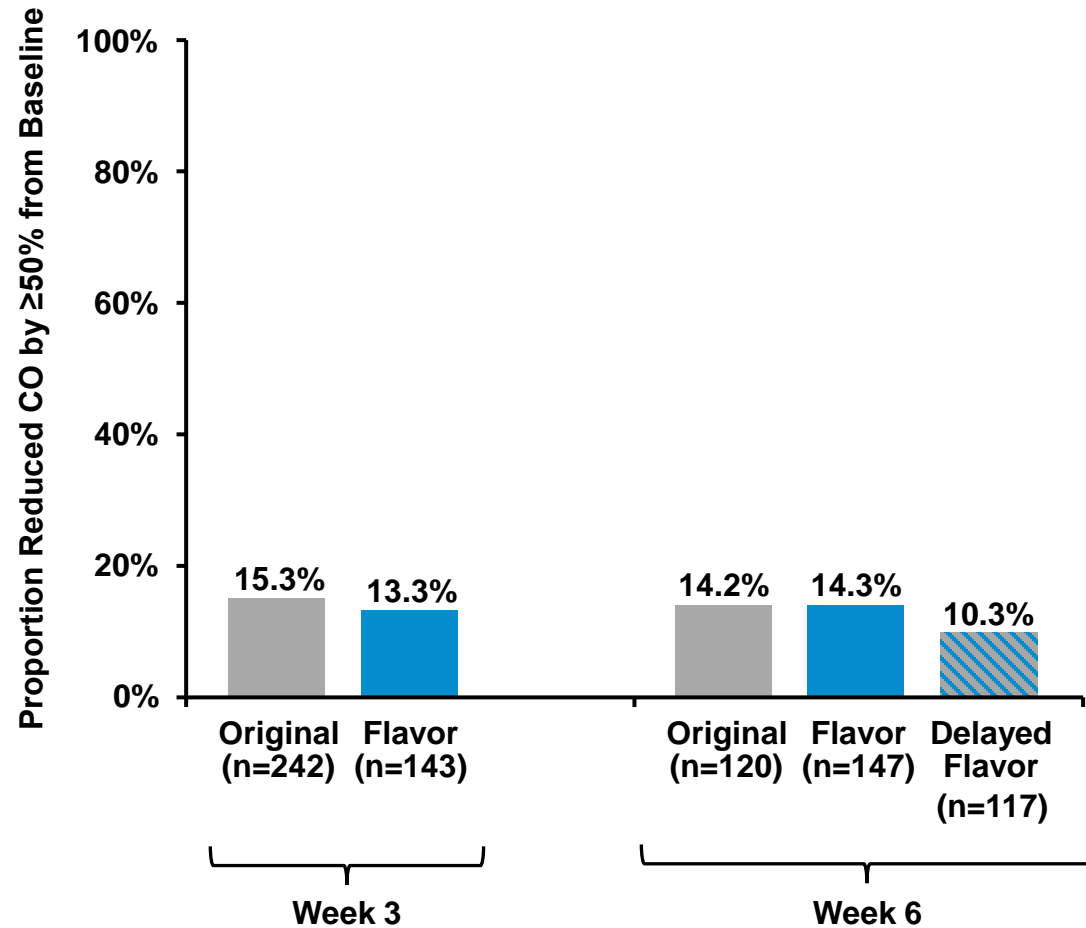

- CO Reduction
- CPD Reduction

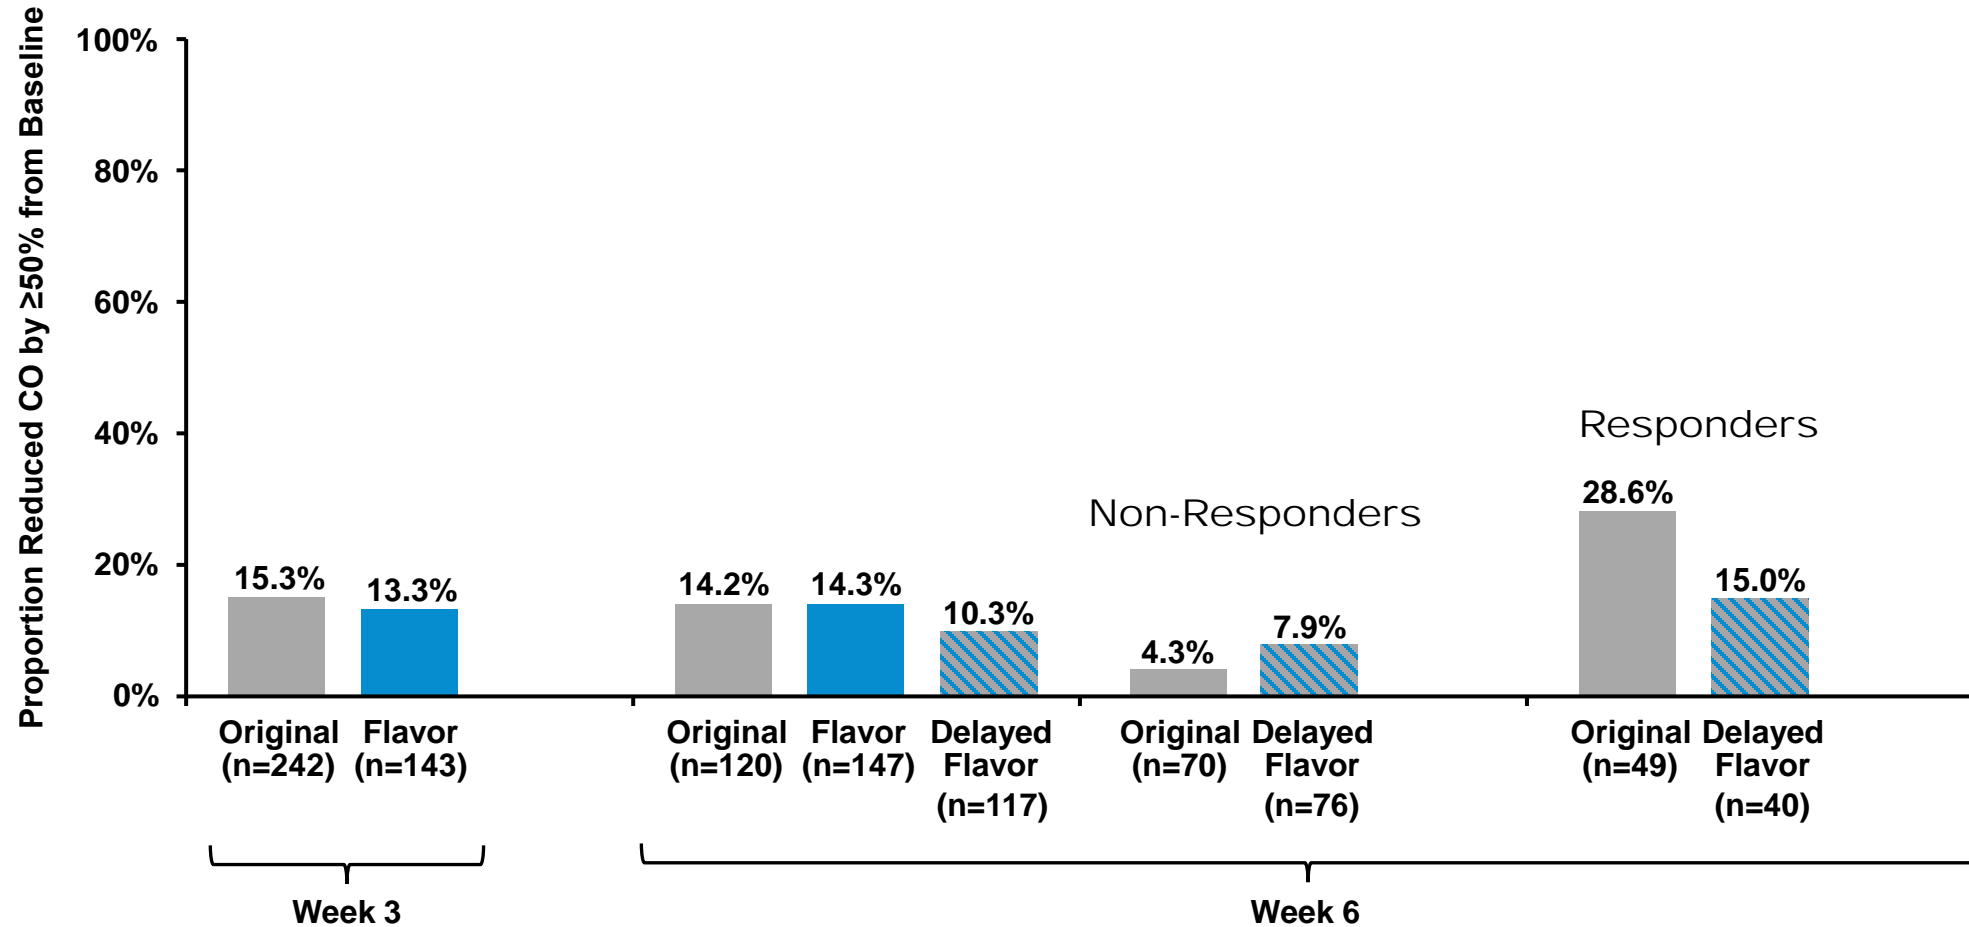

No Differences for $\geq 50\%$ CO Reduction

No Differences for $\geq 50\%$ CO Reduction

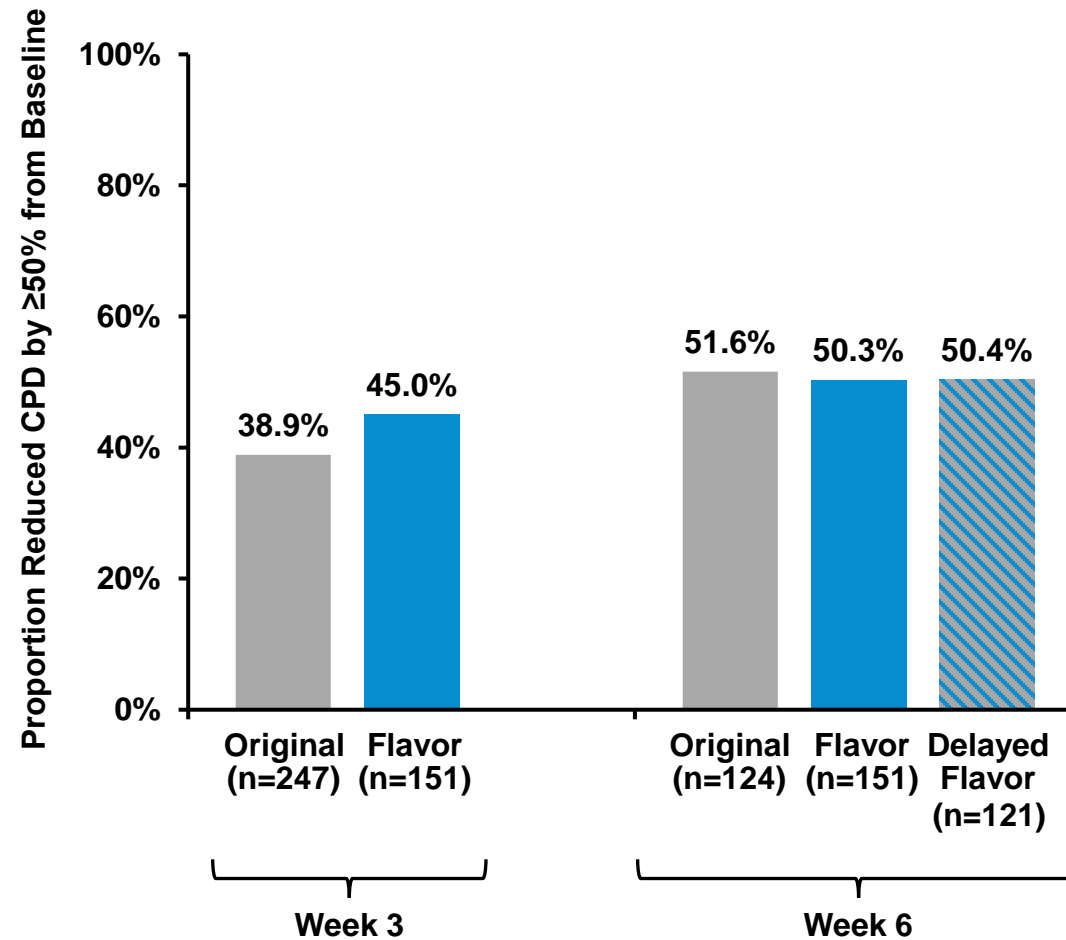

No Differences for $\geq 50\%$ CO Reduction

Rescue Effect for $\geq 50\%$ CPD Reduction

Rescue Effect for $\geq 50\%$ CPD Reduction

Rescue Effect for $\geq 50\%$ CPD Reduction

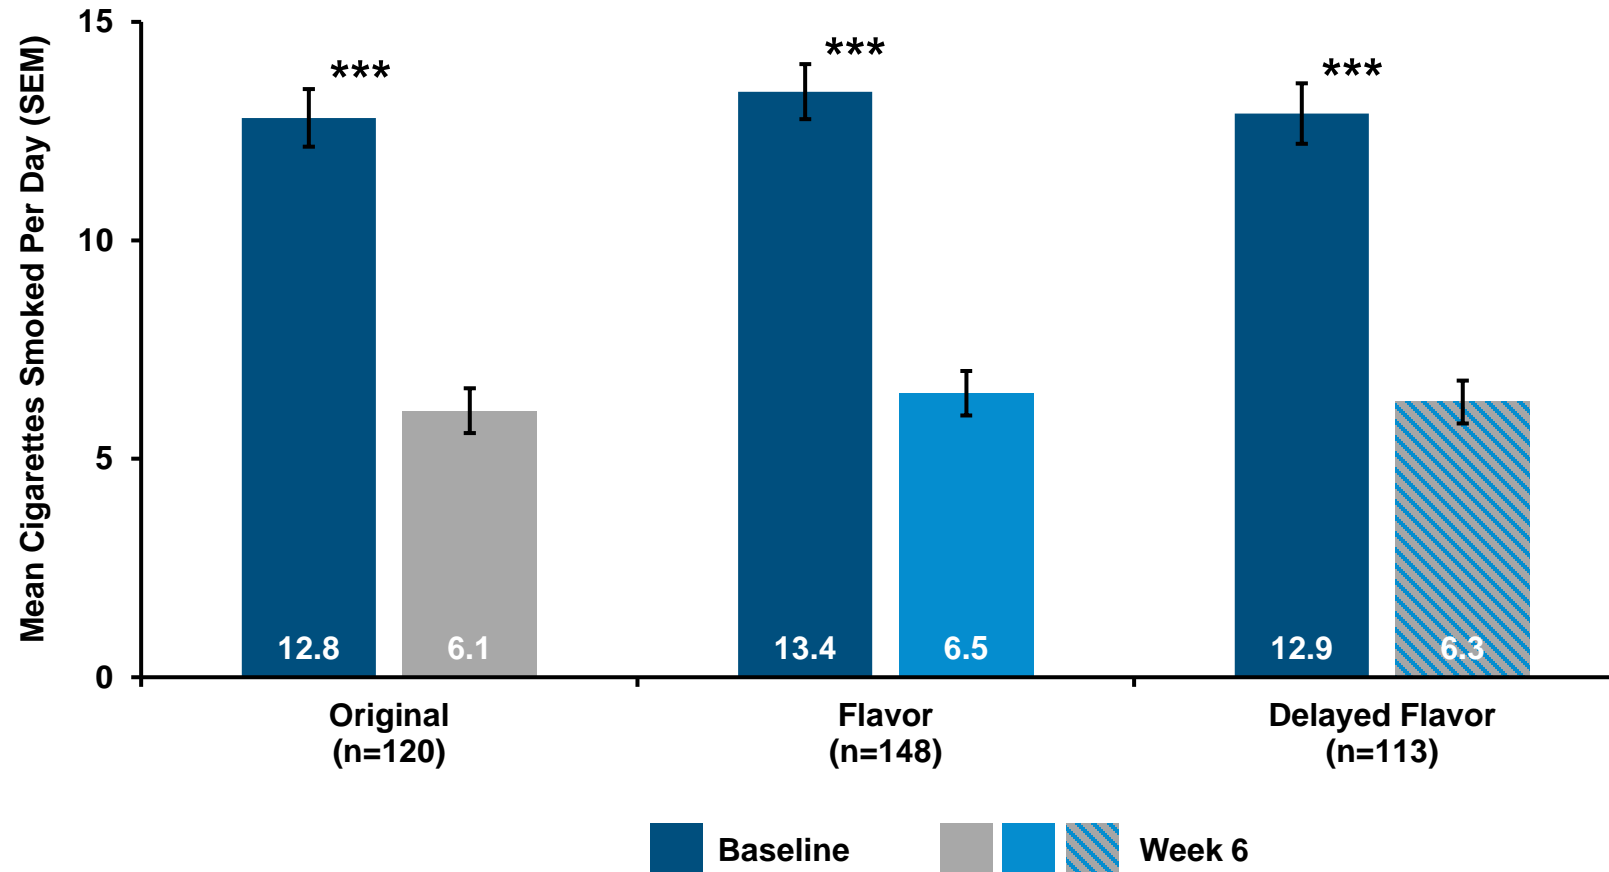

* Indicates p<0.05

Altria

CPD Significantly Reduced Among Those Smoking in Week 6

**Among Those
Smoking in Week 6:**

Statistically
significant CPD
reduction
within each Group

*** Indicates p < 0.001

Altria

Results

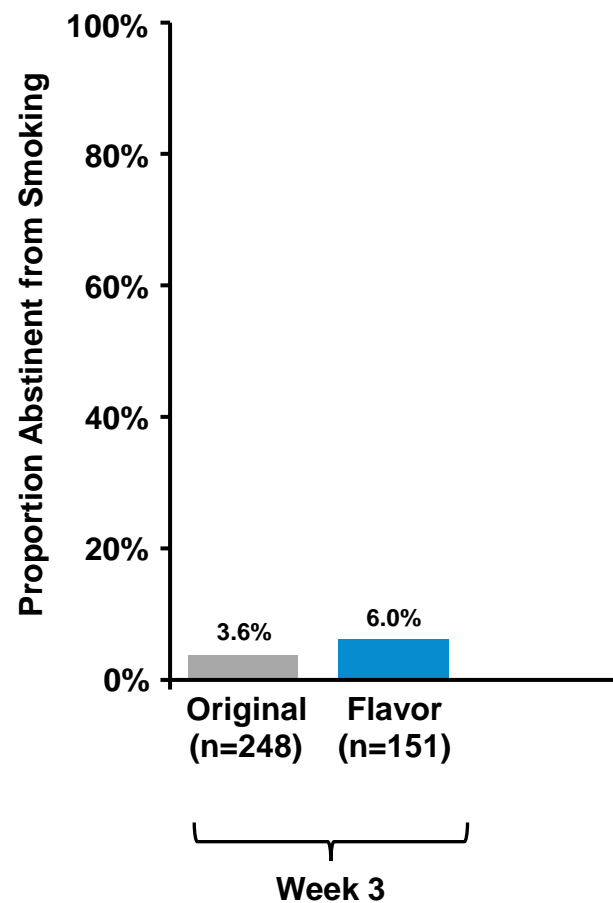

Smoking Abstinence:

- CO-Verified
- Self-Reported Smoke-free Days

No Differences for CO-verified Smoking Abstinence

Smoking Abstinence defined as meeting both criteria: no self-reported cigarettes smoked and mean CO < 6 ppm for given week

No Differences for CO-verified Smoking Abstinence

Smoking Abstinence defined as meeting both criteria: no self-reported cigarettes smoked and mean CO < 6 ppm for given week

No Differences for CO-verified Smoking Abstinence

Smoking Abstinence defined as meeting both criteria: no self-reported cigarettes smoked and mean CO < 6 ppm for given week

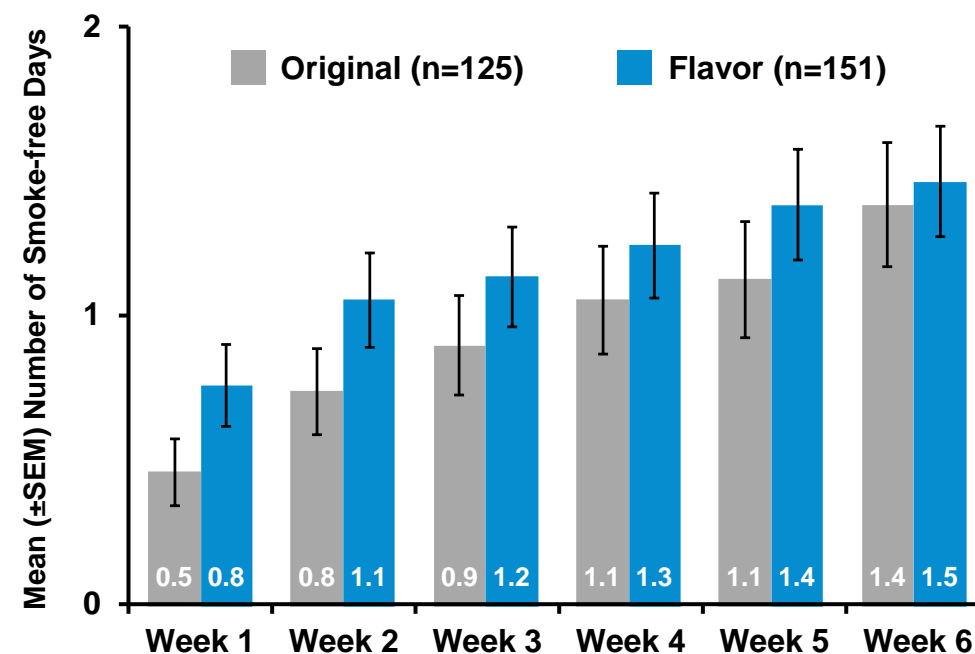

Flavor Availability Increased Incidence of Smoke-free Days

Stronger Effect for Flavor Earlier

- Larger proportion of Flavor Group reported Smoke-free Days
- Original lower at Week 1; caught up in Week 3

Similar Pattern for Number of Smoke-free Days

Results

Week 6 Results:

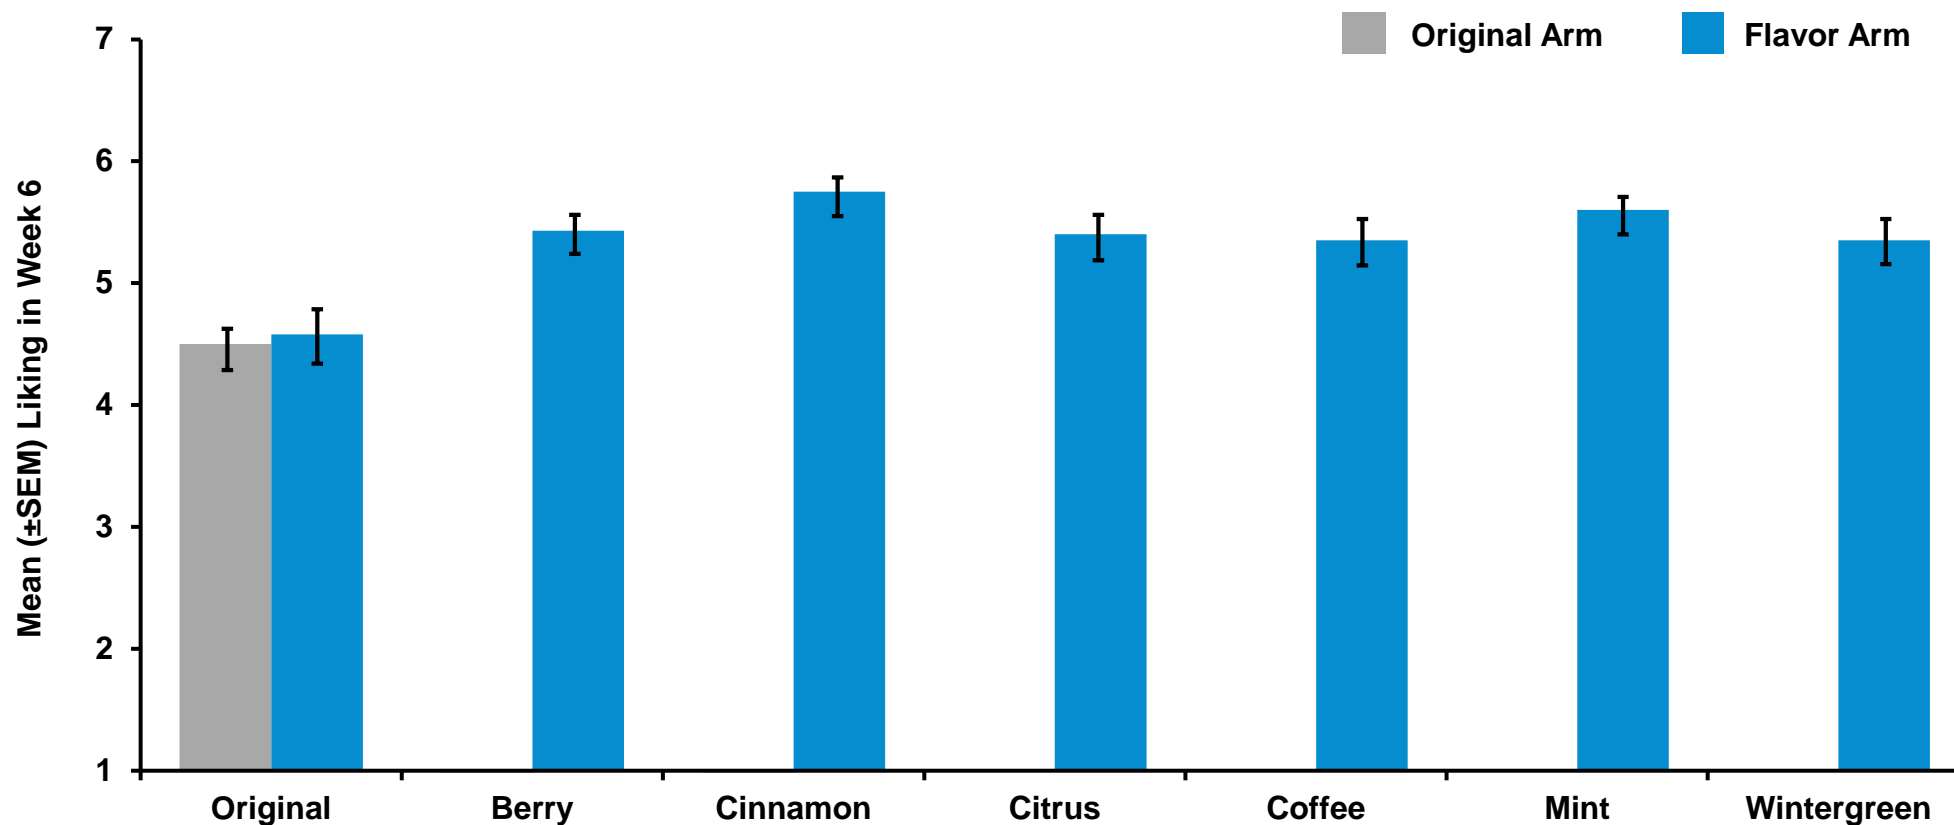

- Flavor Use
- Product Liking
- Purchase Intent

Flavors Used More than Original in Week 6

Flavors Liked More than Original

Higher Purchase Intent for Flavors

Original Arm was not provided flavors during the study, but they were asked about purchase intent for all flavors at end of study

Study Limitations

- ⊗ Study product provided at no charge
 - Could have artificially inflated use

- ⊗ Only one nicotine level provided (4 mg)
 - May not have met expectations for all participants
 - Could have limited smoking reduction or abstinence

- ⊗ Expired-air CO measured once every three days
 - Averaging CO across measurements separated by multiple days may not be a valid representation of smoking behavior
 - Half-life of CO is 2-8 hours (depending on physical activity level)

Key Takeaways

Overall use of on!® nicotine pouch products led to CPD reduction

- Half of participants were able to **reduce CPD by $\geq 50\%$** by end of study
- Magnitude of **reduction was statistically significant** within each Study Arm
- **Rescue effect** for Delayed Access to Flavors
 - May be possible to ascertain need for “rescue” early

Access to Flavors increased incidence of smoke-free days early

Number of smoke-free days was modest

Flavors were used *more*, liked *more*, and had higher purchase intent

Implications

Continued use of on!® nicotine pouch products can reduce cigarette smoking or lead to smoke-free days

Access to flavors had a stronger impact earlier

Occurs with **access to Original**, but takes longer and requires persistence

For adults who smoke cigarettes in the real world:

- Persistent use is unlikely if they do not like the product and are not seeing results
- Access to a variety of products that are liked and lead to desired results is critical
 - e.g., smoking reduction or complete switching away from cigarettes
- Actual Use or Longitudinal Cohort Studies may better characterize real-world use behaviors than an RCT

THANK YOU!
