

Demystifying AI for supply chain leaders

Artificial Intelligence lightens the load for the warehouse

Why AI is a good thing for warehouse teams

As the backbone of the supply chain, warehouses carry a heavy load in today's volatile business landscape. With nearshoring increasing demand for warehouse capabilities, combined with the effect of chronic labor shortages, the pressure on warehouse professionals has never been greater.

Modern warehouses also require teams to become proficient with advanced technology and automation systems, which adds another layer of difficulty to their already demanding roles.

Are warehouse teams set up to succeed in the current supply chain paradigm?

What's holding back warehouse professionals?

Abrupt fulfillment shifts

Warehouses are being hit by disruptions in everything from suppliers to transportation and end customers.

Slow information

Hindered by a lack of up-to-date information, time-to-complete tasks are saddled with inefficiency.

Integration hesitation

Warehouse professionals are reluctant to embrace hybrid (robot/human) workforces because of complexity and uncertainty.

AI eases the burden

- **Precise robotic management**
AI management enables smarter collaboration between workers and robotics, making robots a true partner in the warehouse.
- **Real-time decision-making**
A constant flow of data collected by AI will decrease information delays to improve decision-making and efficiency.
- **Accurate data**
With more accurate data provided by AI, warehouse teams can improve task planning and time management (an likely improve safety).

AI has big benefits for the warehouse, but that's just the beginning. A stronger, more efficient warehouse will have positive effects across the entire supply chain.

Not only will supply chains be more efficient, they will be more nimble, able to adapt to the daily challenges of global volatility.
