

API Access

A seamless integration between different systems is key to an efficient and cost-effective business

API Access provides a flexible access to the data in READy Manager and enables you to share it more easily with other applications and services, including third-party systems. This guarantees a more fluid information delivery and an integrated user experience.

Lower integration cost of CIS systems and customer portals

An API can automate workflows and make them quicker and more productive because computers rather than people can manage the work.

With API Access, you will experience a READy solution that is easy to integrate with third-party systems. This means that the integration cost of customer information systems and customer portals are low.

Minimise the risk of data loss or security breaches

Using API Access to transfer data to third-party systems means that you get a more efficient and secure data transfer – thereby minimising your risk of data loss and security breaches.

Ad hoc collection of single meter data

As the API can access the components in READy Manager, the delivery of data is more flexible. This makes it possible

to collect data from a single meter ad hoc, for example for further analysis of the meter in an analysis tool.

Enabling businesses and operational gains

A flexible access to the data in READy allows you to extract meaningful subsets of data and use them in innovative ways, for example in combination with data from other systems, to create new products and tools – or improve existing ones.

You may, for example, want to create consumer apps by exposing selected data to your customers and thereby take the opportunity to improve customer engagement and develop new business areas.

You can also use the data to create internal tools for you and your colleagues to improve operational efficiency and customer service.

Why API Access matters

An API provides flexibility in a world of change. Not only does it allow you to incorporate seamless integration and interoperability, but it also allows your business to put your data to good use by enabling the creation of new business opportunities and improving existing products, systems and operations.
