

Corporate Information Security Policy

Document revision 2024-10-29 09:45

Kamstrup is committed to securing its business from information security breaches and threats, while also protecting the information assets of its customers, partners, and employees. Kamstrup does so through a combination of technological measures, physical controls, and organizational practices in line with strategic ambitions, and legal and regulatory requirements.

In addition to maintaining the core security concepts of confidentiality, integrity, and availability, Kamstrup includes Risk Management and User Awareness among them. Kamstrup expects and empowers all employees to serve as advocates for information- and cyber-security, and to uphold these concepts by:

- Staying aware of the security responsibilities in their area of expertise.
- Participating in the recommended learning related to information- and cyber- security.
- Reporting any security concerns or suspicious activity through the appropriate channel.
- Raising non-conformities and risks, should they become aware that a solution, vendor, process, or design is unable to uphold the necessary requirements. Any exceptions are handled through these actions.

Improvements to information- and cyber security practices are performed based on regular reviews of the above activities, as well as forecasted risks and threats, external demands, and benchmarking against international standards. In doing so, Kamstrup ensures its commitment to compliance and upholds its certified Integrated Management System.
