INTRODUCTION

Risk-based managed care is the current platform from which Medicaid recipients receive healthcare benefits, at least in part, in more than 30 states in the United States. Managed care organizations (MCOs) of all varieties contract with state Medicaid agencies to deliver and manage the healthcare benefits under the Medicaid program in exchange for predetermined capitation revenue.

Most states require that a contracted MCO also be a licensed health maintenance organization (HMO), which includes the requirement to file a statutory annual statement with the state insurance regulator. This statutory HMO annual statement is a standard reporting structure developed and maintained by the National Association of Insurance Commissioners (NAIC) with prescribed definitions allowing comparisons among various reporting entities.

This report summarizes the calendar year (CY) 2010 experience for selected financial metrics of organizations reporting Medicaid (Title XIX) experience. The information was compiled from the reported annual statements.¹ Companies may be excluded from this report if they did not submit an annual statement, if they have less than \$10 million in annual Medicaid (Title XIX) revenue, if they are a specialized behavioral health or community care plan, or if they are omitted from the annual statement software.

The primary purpose of this report is to provide reference and benchmarking information for certain key financial metrics used in the day-to-day analysis of Medicaid MCO financial performance.

The primary purpose of this report is to provide reference and benchmarking information for certain key financial metrics used in the day-to-day analysis of Medicaid MCO financial performance. The financial results are summarized on a composite basis for all reporting MCOs. Additionally, this report explores the differences among various types of MCOs using available segmentation attributes defined from the reported financial statements.

The target audiences of this report include state Medicaid agency and MCO personnel responsible for reviewing and monitoring the financial results of a risk-based managed care program.

The intent is that this report will be updated on an annual basis. This is the third version of the report reflecting CY 2010 information. Previous versions of this report can be obtained from the Milliman website (www.milliman.com). The methodology used to generate this report is substantially consistent with the previous year's report.

¹ National Association of Insurance Commissioners Annual Statement Database, as delivered by Highline Data, LLC, a division of Summit Business Media, LLC, all rights reserved.

SUMMARY OF RESULTS

The CY 2010 annual statements for 30 states and territories comprising 148 MCOs were compiled to produce outcomes of key financial metrics for various company groupings. The distribution of results is summarized in this report to allow for user reference and benchmarking purposes.

MCOs reporting \$10 million or more in annual Medicaid (Title XIX) revenue, excluding specialized behavioral health and community care plans, were retained and categorized using certain key attributes. The attributes included the Centers for Medicare and Medicaid Services (CMS) region, annual Medicaid revenue, Medicaid revenue per member per month (PMPM), type of MCO (Medicaid only or Medicaid other), affiliation type of MCO (independent or affiliated), MCO financial structure, pharmacy indicator, and underwriting (UW) gain or loss.

The financial metrics include the medical loss ratio (MLR), administrative loss ratio (ALR), underwriting ratio (UW Ratio), and risk-based capital ratio (RBC Ratio). The selected metrics focus primarily on the income statement values of the financial statement, with the exception of the RBC Ratio, which is a capital (or solvency) measure.

Figure 1 summarizes the composite CY 2010 financial results for the 148 companies meeting the criteria selected for this study. The companies represent experience from 30 states with over \$52 billion in revenue.

The CY 2010 annual statements for 30 states and territories comprising 148 MCOs were compiled to produce outcomes of key financial metrics for various company groupings.

FIGURE 1: COMPOSITE CY 2010 FINANCIAL RESULTS

FINANCIAL METRIC	COMPOSITE MEAN	25TH PERCENTILE	50TH PERCENTILE	75TH PERCENTILE
MEDICAL LOSS RATIO (MLR)	85.5%	82.0%	85.7%	90.1%
ADMINISTRATIVE LOSS RATIO (ALR)	11.9%	9.1%	12.1%	14.2%
UW RATIO	2.6%	(0.5%)	2.6%	5.5%
RBC RATIO	514%	328%	417%	587%

1. Values have been rounded.
2. The percentile distributions were developed independently for each metric. As such, the MLR plus ALR plus UW Ratio do not necessarily sum to 100%.

Figure 2 summarizes the composite financial results for the most recent five-year period. The companies in each year are not the same; however, the criterion used to select the companies is consistent from year to year.

FIGURE 2: COMPOSITE FINANCIAL RESULTS					
FINANCIAL METRIC	CY 2006	CY 2007	CY 2008	CY 2009	CY 2010
MEDICAID REVENUE (IN \$ BILLIONS)	\$28.7	\$32.5	\$39.4	\$48.1	\$52.4
MEMBER MONTHS (IN MILLIONS)	145	147	163	192	211
MEDICAL LOSS RATIO (MLR)	86.2%	87.3%	87.2%	88.0%	85.5%
ADMINISTRATIVE LOSS RATIO (ALR)	12.3%	11.9%	11.8%	11.5%	11.9%
UW RATIO	1.6%	0.9%	1.0%	0.5%	2.6%
RBC RATIO	527%	528%	464%	446%	514%
COMPANIES REPORTING PDR	6	9	13	21	15
PDR VOLUME (IN MILLIONS)	\$19.3	\$39.0	\$66.0	\$183.6	\$103.3

1. Values have been rounded.

The results illustrated above indicate that, in aggregate, the financial results for the MCOs in this report improved significantly in 2010, in contrast to the deteriorating pattern that is illustrated through 2009.

The results illustrated above indicate that, in aggregate, the financial results for the MCOs in this report improved significantly in 2010, in contrast to the deteriorating pattern that is illustrated through 2009. The MLR is lower than in CY 2006 and the ALR returned to pre-2007 levels. Additionally, the amount of capital maintained by the MCOs (measured using the RBC Ratio) increased considerably from 2009. There may be several reasons for the improving experience, including, but not limited to, the lower morbidity of the newly enrolling populations eligible, which is due to the economic downturn and the lower than anticipated flu season (as compared to the H1N1 impacts of 2009).

Figure 2 includes additional insight into the financial condition of the MCOs and the relationship of revenue to expenses. An MCO is required to establish a premium deficiency reserve (PDR) if the estimated revenue and current reserves are insufficient to cover future expenses. The number and amount of PDRs decreased in CY 2010. This indicates that the plans appear to be recovering from increased losses over the past year.

FINANCIAL METRICS

The financial metrics calculated for purposes of this report included the medical loss ratio (MLR), administrative loss ratio (ALR), underwriting ratio (UW Ratio), and risk-based capital ratio (RBC Ratio). The selected metrics focus primarily on the income statement values of the financial statement, with the exception of the RBC Ratio, which is a capital (or solvency) measure.

The financial metrics selected encompass four of the primary ratios used by MCOs, state Medicaid agencies, and other stakeholders to evaluate the financial performance of a health plan. The metrics are defined in greater detail below.

Medical loss ratio (MLR)

Medical loss ratio (MLR) is a common financial metric used to report and benchmark the financial performance of an MCO. The MLR represents the proportion of revenue that was used by the MCO to fund claim expenses. The MLR is stated as a percentage with claim expense in the numerator and premium revenue in the denominator.

In terms of the statutory annual statement, the MLR was defined as follows:

$$\text{MLR} = \frac{\text{Total Hospital and Medical Expenses} + \text{Increase in Reserves for A\&H Contracts}}{\text{Total Revenue}}$$

Where: Total Hospital and Medical Expenses: Title XIX–Medicaid (P.7, L.17, C.8)
 Increase in Reserves for Accident and Health (A&H) Contracts: Title XIX–Medicaid (P.7, L.21, C.8)
 Total Revenue: Title XIX–Medicaid (P.7, L.7, C.8)

Note: Certain states include pass-through type programs such as franchise fees or provider taxes. These items may or may not be included in the total revenue reported by the MCO because the reporting practices vary among plans. If reported in the total revenue, there should be a corresponding offset amount included in the administrative costs for this as well.

Actuaries and financial analysts use the MLR as a measure of premium adequacy and often compare the resulting MLR to a “target” level. The MLR alone is not sufficient to compare MCO financial results among various states and programs. The target loss ratios (the claim cost included in the premium or capitation rate) vary by state and populations enrolled. Additionally, there may be reporting differences among MCOs as to what is classified as medical expense versus administrative expense.

It should be noted that the definition of MLR for purposes of this report may not be consistent with other definitions, in particular the MLR definition resulting from the Patient Protection and Affordable Care Act (PPACA) provisions for minimum loss ratios for commercial plans.

Administrative loss ratio (ALR)

Administrative loss ratio (ALR) is also a common financial metric used to report and benchmark the financial performance of an MCO. The ALR represents the proportion of revenue that was used by the MCO to fund administrative expenses. The ALR is stated as a percentage with administrative expense in the numerator and premium revenue in the denominator.

The financial metrics calculated for purposes of this report included the medical loss ratio (MLR), administrative loss ratio (ALR), underwriting ratio (UW Ratio), and risk-based capital ratio (RBC Ratio)

In terms of the statutory annual statement, the ALR was defined as follows:

ALR =	$\frac{\text{Claim Adjustment Expenses} + \text{General Administrative Expenses}}{\text{Total Revenue}}$
Where:	Claim Adjustment Expenses: Title XIX–Medicaid (P.7, L.19, C.8) General Administrative Expenses: Title XIX–Medicaid (P.7, L.20, C.8) Total Revenue: Title XIX–Medicaid (P.7, L.7, C.8)

Note: Certain states include pass-through type programs such as franchise fees or provider taxes. These items may or may not be included in the total revenue reported by the MCO because the reporting practices vary among plans. If reported in the total revenue, there should be a corresponding offset amount included in the administrative costs for this as well.

The ALR requires interpretation and considerations similar in nature to the MLR metric outlined above.

Underwriting Ratio

The underwriting ratio (UW Ratio) is the sum of the MLR and the ALR compared to 100%. A positive UW Ratio indicates a gain, while a negative UW Ratio indicates a loss. This financial metric is used to report and benchmark the financial performance of an MCO in consideration of both medical and administrative expenses. The UW Ratio represents the proportion of revenue that was “left over” to fund the MCO’s contribution to surplus and profit after funding medical and administrative expenses. The UW Ratio is stated as a percentage with total underwriting gain or loss in the numerator and premium revenue in the denominator.

In terms of the statutory annual statement, the UW Ratio was defined as follows:

UW Ratio =	$\frac{\text{Net Underwriting Gain (or Loss)}}{\text{Total Revenue}}$
Where:	Net Underwriting Gain (or Loss): Title XIX–Medicaid (P.7, L.24, C.8) Total Revenue: Title XIX–Medicaid (P.7, L.7, C.8)

Note: Certain states include pass-through type programs such as franchise fees or provider taxes. These items may or may not be included in the total revenue reported by the MCO because the reporting practices vary among plans. If reported in the total revenue, there should be a corresponding offset amount included in the administrative costs for this as well.

The UW Ratio is focused on the income from operations and excludes consideration of investment income and income taxes. The UW Ratio requires interpretation and considerations similar in nature to the MLR and ALR metrics outlined above.

Risk-based capital ratio (RBC Ratio)

The risk-based capital ratio (RBC Ratio) is a financial metric used by many insurance regulators to monitor the solvency of the MCOs. The RBC Ratio represents the proportion of the required minimum capital that is held by the MCO as of a specific date (the end of the financial reporting period). The RBC Ratio is stated as a percentage or a ratio with total adjusted capital (TAC) in the numerator and authorized control level (ACL) in the denominator.

The National Association of Insurance Commissioners (NAIC) prescribes a specific formula to develop both the TAC and the ACL. Further, the MCO is subjected to various action levels based on the resulting RBC Ratio as follows:

- Company action level (TAC is between 150% and 200% of the ACL RBC Ratio)
- Regulatory action level (TAC is between 100% and 150% of the ACL RBC Ratio)
- Authorized control level (TAC is between 70% and 100% of the ACL RBC Ratio)
- Mandatory control level (TAC less than 70% of the ACL RBC Ratio)

Further details and discussion of the RBC Ratio requirements may be found at the NAIC website (www.naic.org).

In terms of the statutory annual statement, the RBC Ratio was defined as follows:

RBC Ratio =	$\frac{\text{Total Adjusted Capital}}{\text{Authorized Control Level}}$
Where:	Total Adjusted Capital: Total Adjusted Capital—Current Year (P.29, L.14, C.1) Authorized Control Level: Authorized Control Level—Current Year (P.29,L.15, C.1)

Note: The RBC Ratio is not unique to the Medicaid Title XIX line of business as it is calculated at the company level. Therefore, companies reporting non-Medicaid business will reflect composite RBC Ratios for all lines of business within the reported legal entity.

MCO GROUPING

MCOs reporting \$10 million or more in annual Medicaid (Title XIX) revenue, excluding specialized behavioral health and community care plans, were retained and categorized using certain key attributes. The attributes included the CMS region, annual Medicaid revenue, Medicaid revenue per member per month (PMPM), type of MCO (Medicaid only or Medicaid other), affiliation type of MCO (independent or affiliated), MCO financial structure, pharmacy indicator, and UW Ratio gain or loss.

The MCO groupings selected encompass plan characteristics that were available on the reported financial statements and may be expected to exhibit differing results for the selected financial metrics.

The MCO groupings selected encompass plan characteristics that were available on the reported financial statements and may be expected to exhibit differing results for the selected financial metrics. The groupings are defined in greater detail below.

CMS Region

Healthcare delivery and premium revenue are believed to vary by geographic location. As such, it may be inferred that at least some portion of the financial results for an MCO are correlated to the geographic area in which the MCO is operating.

This report includes an MCO grouping representing the geographic segmentation of MCOs. The region was defined using the Centers for Medicare & Medicaid Services (CMS) regional definitions. These definitions were taken from the CMS website (www.cms.hhs.gov). The region grouping is not the specific level at which premiums or capitations are established, however, and this could diminish the value of correlation among financial results at this grouping level.

FIGURE 3: CMS REGION

CMS REGION	N	MLR	ALR	UW RATIO	RBC RATIO
REGION 1	9	90.1%	7.9%	1.9%	428%
REGION 2	16	86.5%	10.9%	2.6%	638%
REGION 3	21	86.4%	11.1%	2.5%	482%
REGION 4	24	86.1%	12.3%	1.6%	367%
REGION 5	42	83.2%	13.2%	3.6%	457%
REGION 6	18	84.3%	12.9%	2.8%	458%
REGION 7	8	87.4%	9.9%	2.7%	427%
REGION 8	0				
REGION 9	5	89.7%	11.6%	(1.2%)	614%
REGION 10	5	84.8%	12.9%	2.2%	800%

Note: The observed differences among the mean values for the MLR, the ALR, the UW Ratio, and the RBC Ratio were determined to be statistically significant for certain regions. Specifically:

- Region 5 has a higher UW Ratio mean value and Regions 4 and 9 have lower UW Ratio mean values.
- Regions 1 and 4 have higher MLR mean values and Regions 5 and 6 have lower MLR mean values.
- Region 10 has a higher ALR mean value and Regions 1 and 7 have a lower ALR mean value.
- Regions 2, 9, and 10 have higher RBC Ratio mean values and Region 4 has a lower RBC Ratio mean value.

The state in which the MCO is incorporated (State of Domicile) was considered for segmentation purposes because the combination of MCO and State of Domicile is the finest level of detail available for reporting the statutory annual statement values. The state level is also the level at which the premiums are calculated, ignoring populations enrolled, intrastate regions, and other premium rating characteristics. As such, the resulting financial performance for MCOs within a state may be thought to be correlated in some way given the homogeneous program characteristics and premium rating methodology. However, the State of Domicile in certain cases may contain only a limited number of data points from which to compile reasonable results.

Annual Medicaid Revenue

The annual revenue under which the MCO operates may be a contributing factor to the resulting financial performance metrics summarized in this report. Administrative expense percentages are believed to vary based on MCO size because of fixed and variable expense structures. Additionally, claim volume may also dictate the amount of leverage an MCO has in negotiations with providers regarding reimbursement levels.

The drawback of developing conclusions based on annual Medicaid revenue is that often MCOs, at the organization or parent company level, are larger than the Medicaid revenue they report in a given state program. The business in other programs such as Medicare and commercial or business in other states may provide the economies of scale to spread costs and create efficiencies. This distinction is not included in this report as each MCO and state was assumed to be an independent data point.

FIGURE 4: ANNUAL MEDICAID REVENUE

ANNUAL MEDICAID REVENUE	N	MLR	ALR	UW RATIO	RBC RATIO
\$10 TO \$50 MILLION	18	93.6%	14.4%	(8.1%)	544%
\$50 TO \$100 MILLION	26	88.7%	11.9%	(0.6%)	642%
\$100 TO \$250 MILLION	39	85.4%	12.1%	2.5%	567%
MORE THAN \$250 MILLION	65	85.3%	11.9%	2.9%	479%

Note: The observed differences among the mean values for the UW Ratio were determined to be statistically significant.

The results shown in Figure 4 indicate that the \$10 million to \$50 million category has observed significantly less favorable financial performance than the larger revenue categories. This may be attributable, in part, to a limited ability to absorb the increased financial pressures put on MCOs, which is due to the economic downturn and its impact on state budgets.

Medicaid revenue PMPM

Within Medicaid, there are various population types that observe significantly different claim costs. For example, the average claims per member per month (PMPM) for a typical Temporary Assistance for Needy Families (TANF) population is expected to be significantly less than a disabled population. The segmentation of population was not available on the data used in this report. As such, the revenue PMPM was used as a proxy to indicate different population morbidities. The specific categories were selected to yield a sufficient sample size in each group such that comparison would be meaningful.

FIGURE 5: MEDICAID REVENUE PMPM

MEDICAID REVENUE PMPM	N	MLR	ALR	UW RATIO	RBC RATIO
\$0 TO \$225	62	86.6%	11.7%	1.7%	514%
\$225 TO \$300	56	84.2%	12.6%	3.2%	534%
MORE THAN \$300	30	86.0%	11.3%	2.6%	473%

Note: The observed differences among the mean values were not determined to be statistically significant.

The results shown in Figure 4 indicate that the \$10 million to \$50 million category has observed significantly less favorable financial performance than the larger revenue categories.

Type of MCO (Medicaid only or Medicaid other)

MCOs participating in Medicaid managed care programs may be a Medicaid-only plan or may participate in programs other than Medicaid. The purpose of this segmentation is to review the results of plans that are only focused on Medicaid programs as opposed to a more diverse product offering.

Medicaid Other refers to any MCO reporting \$10 million or more of Medicaid revenue, but also reporting other lines of business making up more than 10% of the total revenue.

FIGURE 6: MCO TYPE

MCO TYPE	N	MLR	ALR	UW RATIO	RBC RATIO
MEDICAID ONLY	58	85.0%	12.6%	2.3%	378%
MEDICAID OTHER	90	85.9%	11.3%	2.8%	553%

Note: The observed differences among the mean values for the ALR and the RBC Ratio were determined to be statistically significant.

The annual statements of MCOs are reported at the legal entity level. Many MCOs create separate legal entities for the Medicaid line of business. This practice complicates a comparison of Medicaid-only and other Medicaid MCOs in that a Medicaid-only MCO may be a subsidiary of a larger parent organization.

Affiliation type of MCO (independent or affiliated)

The complications with the definitions of legal entities described above can be mitigated somewhat by using parent company information for the MCO legal entity located on the jurat page of the annual statement.

Many researchers and analysts believe that an MCO that is affiliated with a larger organization will benefit from administrative efficiencies and other economies of scale because of their resource-sharing and overhead allocation capabilities. The economies of scale could also extend to claim items such as national prescription benefit management (PBM) contracts or stop-loss reinsurance contracts.

FIGURE 7: MCO AFFILIATION TYPE

MCO AFFILIATION TYPE	N	MLR	ALR	UW RATIO	RBC RATIO
INDEPENDENT	39	87.9%	9.7%	2.4%	510%
AFFILIATED	109	85.0%	12.4%	2.6%	515%

Note: The observed difference among the mean values for the MLR and ALR were determined to be statistically significant.

The results shown in Figure 7 do not indicate that MCOs that are affiliated with a larger organization experience ALR values that are, on average, lower than the independent MCOs. To the contrary, the results indicate a higher average ALR for MCOs that are affiliated with a larger organization. The mean MLR, however, is lower for affiliated MCOs.

MCO financial structure (profit, nonprofit)

The MCO financial structure was defined using the company type found on the jurat page of the annual statement. The segmentation of the financial structure includes profit and nonprofit MCOs. For several companies, the reported values were revised from profit to nonprofit based on desk research we conducted for purposes of this report.

The financial structure of an MCO is thought by some to be correlated to its resulting financial performance. For example, profit companies could be assumed to require higher UW Ratios to provide a greater return on investment for shareholders while nonprofit companies may be generally focused on "break-even" results as long as there is sufficient contribution to surplus to allow for ongoing research and development as well as other capital initiatives.

The results indicate a higher average ALR for MCOs that are affiliated with a larger organization. The mean MLR, however, is lower for affiliated MCOs.

FIGURE 8: MCO FINANCIAL STRUCTURE

FINANCIAL STRUCTURE	N	MLR	ALR	UW RATIO	RBC RATIO
PROFIT	95	84.9%	12.6%	2.5%	415%
NONPROFIT	53	86.7%	10.7%	2.7%	616%

Note: The observed differences among the mean values for the MLR, the ALR, and the RBC Ratio were determined to be statistically significant.

The results shown in Figure 8 indicate that the profit companies exhibit a higher ALR compared to nonprofit. The RBC Ratios indicate a mean value that is lower for profit companies. This appears intuitive in that the nonprofit companies may retain more of their earnings and thus have an increased capital level as compared to profit companies that may release capital in the form of dividends or stock repurchase initiatives.

Pharmacy indicator

Pharmacy benefits typically make up approximately 15% to 20% of the total claim cost for Medicaid beneficiaries enrolled in managed care. Certain states include pharmacy within the capitation rate while others carve this and potentially other services out of the capitation agreement and make separate arrangements for their payment.

The purpose of reporting the financial results of programs with or without pharmacy benefits in the capitation rates is due to the potential impact of the unique administrative structure of the pharmacy benefits as well as the potential impact of pharmacy management on other medical services within the risk-based structure.

The results shown in Figure 8 indicate that the profit companies exhibit a higher ALR compared to nonprofit.

The resulting mean values vary for plans that carve-in pharmacy as compared to plans that carve-out pharmacy.

FIGURE 9: PHARMACY INDICATOR

PHARMACY INDICATOR	N	MLR	ALR	UW RATIO	RBC RATIO
PHARMACY INCLUDED	88	86.7%	11.3%	2.0%	505%
PHARMACY EXCLUDED	60	83.4%	13.1%	3.5%	525%

Note: The observed differences among the mean values were not determined to be statistically significant.

As indicated in Figure 9, the resulting mean values vary for plans that carve-in pharmacy as compared to plans that carve-out pharmacy. While not necessarily a causal relationship, it appears intuitive that administrative costs for plans with pharmacy included would be lower on a composite basis as the pharmacy component is thought to have a lower administrative cost structure.

Reported gain or loss

It is intuitive that MCOs reporting an underwriting gain would have lower MLRs and/or ALRs than those reporting an underwriting loss. This segmentation is intended to review the average MLR and ALR values, and observe the relative contribution of each component to the gain or loss position.

FIGURE 10: MCO GAIN/LOSS

MCO GAIN / (LOSS)	N	MLR	ALR	UW RATIO	RBC RATIO
REPORTED A GAIN	107	83.9%	12.1%	4.0%	541%
REPORTED A LOSS	41	91.8%	11.3%	(3.1%)	399%

Note: The observed differences among the mean UW Ratio values for this MCO grouping are different by definition. The differences among the mean MLR and ALR values were not subjected to significance testing because of their interdependence with the UW Ratio.

As observed in Figure 10, the mean values of the MLRs appear to be the primary driver of the resulting gain or loss position. The ALR mean values are higher, on average, among plans that reported a gain compared to those that reported a loss. One possible explanation for the ALR results is that there is an administrative cost associated with operating a lower MLR. For example, a health plan may invest in claim edit software that increases administrative costs but reduces the claim costs as a result of the new edits.

Statistical significance of results

The results presented in this report include the average (or mean) value of observations for various MCO groupings for CY 2010. The differences among groupings were tested to determine whether they represent statistically significant differences.

Each MCO and state combination was considered a data point. The total number of data points for CY 2010 was equal to 148. The MCOs were segmented by plan characteristics, which were believed to contribute to the resulting financial metrics outlined in this report. Each mean value was tested to determine the statistical significance of the variation between company groupings. The statistical significance was estimated using the Wilcoxon rank sums (for groupings with only two classes) and the Kruskal-Wallis rank sums (for groupings with more than two classes). Both tests are considered non-parametric and were selected because of the unknown nature of the distribution of the residuals.

The results of the statistical significance testing indicate that several of the differences observed among the mean values are significant at a 95% confidence level.

The results of the statistical significance testing indicate that several of the differences observed among the mean values are significant at a 95% confidence level. However, there are certain groupings that did not exhibit statistical significance, as noted in each specific section. But the results observed, even if not determined to be statistically significant, are still of value to interested parties for reference and benchmarking purposes.

Additionally, it should be noted that statistical significance only indicates correlation among the classes (MCO attributes) and does not necessarily imply the existence of a causal relationship. However, this does not preclude situations where the attributes of the MCOs are causing the observed results. This report does not include the assertion of cause; rather, the results are reviewed for correlation only.

CONCLUSION

Risk-based managed care represents a large portion of total Medicaid expenditures for CY 2010 and the growth will likely continue. MCOs are an integral part of this delivery system and their financial results will help us understand the sustainability of risk-based managed care.

The results provide reference and benchmarking information for certain key financial metrics used in the day-to-day analysis of Medicaid MCO financial performance. The results observed for the MCOs were volatile in nature but did suggest certain correlations among the various MCO characteristics selected for this study.

It will be important to monitor the results over time as the world of healthcare finance continues to evolve and poses new challenges.

Risk-based managed care represents a large portion of total Medicaid expenditures for CY 2010 and the growth will likely continue.

LIMITATIONS AND DATA RELIANCE

The results contained in this report were compiled using data and information obtained from the statutory annual statements for Medicaid MCOs filed with the respective state insurance regulators. The annual statements were retrieved as of May 17, 2011, from the online database. In addition to the limiting criteria used to select companies in this report, certain MCOs may be omitted from this report because of the timing of the annual statement submission or their exclusion from the online database. For example, California and Arizona are known to operate managed care programs, but are not included in this report as there were no annual statements found in the online database for these states.

The information was relied upon as reported and without audit. To the extent that the data reported contained material errors or omissions, the values contained within this report would likewise contain similar reporting errors.

This report is intended for informational purposes only. Milliman makes no representations or warranties regarding the contents of this report to third parties. Likewise, third parties are instructed that they are to place no reliance upon this report that would result in the creation of any duty or liability under any theory of law by Milliman or its employees to third parties.

ABOUT THE AUTHOR

Jeremy Palmer is a principal and consulting actuary with the Indianapolis office of Milliman and is a Fellow of the Society of Actuaries and a member of the American Academy of Actuaries. Mr. Palmer joined Milliman in 2004 and currently has over 15 years of healthcare-related actuarial experience.

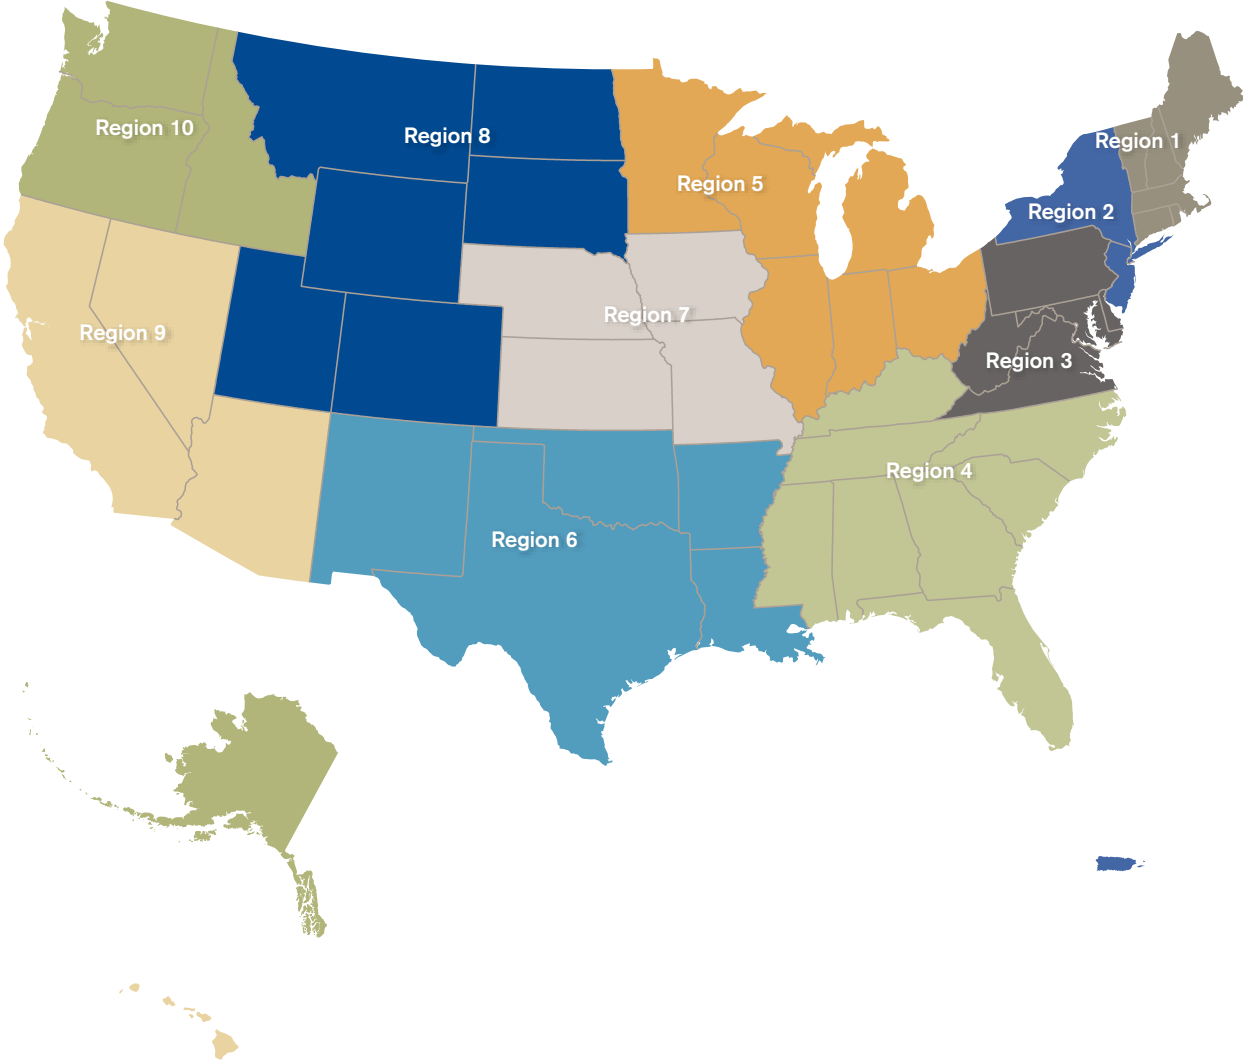

Mr. Palmer has developed an expertise in the financial forecasting, pricing, reporting, and reserving of all types of health insurance, including Medicaid and commercial populations. Much of Mr. Palmer's experience is focused on Medicaid managed care consulting for both state Medicaid programs and Medicaid managed care plans in nine states.

ACKNOWLEDGEMENTS

The author gratefully acknowledges Mr. John Meerschaert, FSA, MAAA, principal and consulting actuary in the Milwaukee office of Milliman for his peer review and comments during the writing of this report.

Additionally, the author expresses gratitude to the health actuarial staff in the Indianapolis office of Milliman for their data mining and statistical support during the writing of this report.

APPENDIX 1

APPENDIX 2

MEDICAL LOSS RATIO: CY 2010 RESULTS
