

A Transmission Solution
to Propel New York State's
Renewable Energy Future

Electric Grid Improvements to Benefit Our Daily Lives

Two trusted leaders in the New York energy industry – New York Power Authority (NYPA) and New York Transco – have collaborated to develop an innovative electric transmission solution for delivering clean energy, including offshore wind energy, into the statewide electric grid through system improvements on Long Island, in New York City and in Westchester County. Building these clean energy pathways will create a more resilient and reliable transmission system for New York homes and businesses. **Join us as we work together to Propel NY Energy.**

A Reliable Grid & Clean Energy

NYPA and New York Transco were selected to construct this project by the New York Independent System Operator. These upgrades, which are subject to regulatory review and approval, are essential to improving the reliability and resiliency of the state's electric grid and providing the enhanced transmission capabilities necessary to deliver clean energy to New York homes and businesses.

Propel NY Energy will accomplish these goals with:

- New and upgraded substations
- Underground and submarine transmission lines carefully routed to avoid and minimize construction impacts while supporting local jobs and economic opportunity

NY Companies Invested in NY Communities

We are New York-based and New York-focused — developing and implementing energy solutions that benefit all New Yorkers in ways that respect and reflect local voices and local values. We are committed to working closely with all stakeholders to ensure our project prioritizes the wellbeing of communities and protects the surrounding environment now and into the future.

Proven NY Energy Experience

Both NYPA and New York Transco have strong records of success in design, permitting and construction of complex transmission projects in New York State. We will bring our best-in-class practices and industry expertise to bolster the downstate electric grid.
